The ultimate programming course cheat sheet for UNIX-like operating system newbies

Directories and files

Concepts

- Files are organised in a directory tree/hierarchy
- Everything is a file (e.g. keyboard, printers, ...)
- Each process has access to the files *stdin* (input), *stdout* (buffered output), *stderr* (unbuffered output)
- Each process operates in a *working directory*
- Each user has a *home directory*

Paths

Path = Identifier for the location of file/directory

- Paths consists of a parent directory list + file/directory
- Files and directories are separated by a '/'
- Directory paths may contain a trailing '/'

Absolute path = Full location (first character = '/')
Relative path = Relative location (first character ≠ '/')

`.`	path to the directory itself
`..`	path to the parent directory
`/usr/bin/ls`	example for an absolute file path
`/home/foo/`	example for an absolute directory path
`./a.out`	example for a relative file path

File system hierarchy

`/`	Root directory
`/bin`	Essential command executables
`/dev`	Device files
`/etc`	System-wide configuration files
`/sbin`	Essential administrative executables
`/tmp`	Temporary files
`/usr`	System resources for users
`/usr/bin`	Command executables
`/usr/local`	Site-local data
`/usr/sbin`	Administrative executables
`/var`	Variable files

`man hier` (or **`man file-hierarchy`** on recent Linux distributions) to get a more detailed overview

Terminal (emulator)

Text terminal = Computer interface for text entry/display
Terminal emulator = Application that emulates a *text terminal* in a graphical environment

Examples for terminal emulators: `xterm`, `urxvt`, `guake`

Opening a terminal

Unity/GNOME	Ctrl + Alt + T
Mac OS	Cmd + [ ] → "terminal" → ↵
Bash on Windows	Win + R → "bash" → ↵

Shell

Unix shell = User interface that accepts commands to operate a computer

`man intro` to get an introduction into basic shell usage

Examples for shell programs: `sh`, `bash`, `zsh`, `fish`, `ksh`

Prompt

Prompt = Text sequence that precedes each command that prompts the user to enter a command

Example prompt in bash: `[foo@bar /var/www]$`
⇒ *user* `foo` is operating in the *working directory* `/var/www` at the computer with the *host name* `bar`

Line editing

Ctrl + A	Go to the beginning of the line
Ctrl + E	Go to the end of the line
Ctrl + U	Clean up to the beginning of the line
Ctrl + K	Clean up to the end of the line
Ctrl + C	Cancel the current command line

Special characters

The following characters can't be used directly:
`| & ; < > ( ) $ ` \" * ? [# ~ = %`
[ ] ⇤⇥ ↵

`\` preserves the literal value of the following character
`' '` preserves the literal values of enquoted characters
`" "` preserves the literal values of enquoted characters except the characters `` ` `` `$` `\`

Expressions

`~`	*home directory* of the current user
`*`	matches any character sequence
`?`	matches a single character
`${var}`	value of the environment variable *var*

Shell utilities

`apropos` `text`	searches the manual pages for *text*
`cat` `file`	prints the contents of *file*
`cd` `dir`	changes the *working directory* to *dir*
`chmod` `prm file`	changes permissions of *file* to *prm*
`cp` `src dst`	copies the file/directory *src* to *dst*
`echo` `text`	prints *text*
`file` `file`	determines the file type of *file*
`find` `dir expr`	finds files in *dir* that match *expr*
`grep` `expr file`	searches for pattern *expr* in *file*
`ls` `dir`	list the entries in the directory *dir*
`man` `cmd`	displays the manual for *cmd*
`mkdir` `dir`	creates the directory *dir*
`mv` `src dst`	moves/renames *src* to *dst*
`pwd`	prints the current *working directory*
`rm` `file`	removes the file *file*
`sort`	sorts lines of text from input
`touch` `file`	creates the empty file *file*

Input output redirection

cmd1 **`|`** ***cmd2***	runs *cmd1* and *cmd2* and redirects the output of *cmd1* to the input of *cmd2*
cmd **`>`** `file`	runs *cmd* and redirects output to *file*, content of *file* is overwritten
cmd **`>>`** `file`	runs *cmd* and redirects output to *file*, the output is appended to *file*
cmd **`<`** `file`	runs *cmd* and redirects *file* to its input

Job control

Job = Shell command and its associated process(es)

- Each job has a job id and corresponding process ids
- Jobs can run in the foreground or in the background
- The execution of a job can be temporarily suspended

cmd `&`	starts *cmd* as background job (id is printed)
`fg` `%job`	puts the job *job* in foreground
`bg` `%job`	continues suspended job *job* in background
`ps`	prints the process ids of all active jobs
`kill` `pid`	terminates a process with the process id *pid*
Ctrl + S	suspends active job
Ctrl + Q	continues active job
Ctrl + Z	puts active job to background and suspends it
Ctrl + C	aborts the active job (most of the times)
